

Enterprise Project Management Implementation Methodology

Our Implementation Methodology is designed to cover the complete requirements for a successful EPM and/or PPM implementation, not simply a technology deployment of computer hardware and software. Success requires the integration of a number of key elements – Skills Development, Processes and Procedures, Technology, and People Change Management.

- **Skills Development**
 - We work with our clients to identify skills development requirements and a training plan to meet these objectives.
- **Processes and Procedures**
 - We work with our clients to understand and document their current processes and explain how some of these processes will change with the introduction of EPM.
 - Our goal is to identify, communicate and implement best practices for EPM.
- **Technology**
 - We have skilled consultants that are very experienced in the configuration of MS Project Server as well as the extension of the platform to meet the objective of the implementation.
- **People Change Management**
 - We work with our clients to help them build and execute a strategy to manage the cultural change and other issues that arise from an EPM implementation.

Implementation Methodology

We strongly believe that a successful implementation is the result of an iterative approach. Our implementation methodology reflects this belief.

The objective of this approach is to identify the most important business requirement and/or user group and address the need, expanding the roll-out in future phases across larger audience or to suit additional business requirements.

Note that the Recommended Business Processes and Procedures, and People Change Management Plan start at the beginning of the project and continually evolve throughout.

The Process
